

Change Request: wildfire season mutual-aid expansion

Aurora is introducing three changes ahead of the next wildfire season:

1. Mutual-aid contractors will receive temporary field access to accelerate restoration.
2. Drone inspection imagery will be ingested to prioritize damaged feeders.
3. Satellite failover sync will be enabled for field tablets when terrestrial backhaul is unavailable.

New or changed components:

- Mutual Aid Contractor Console [external_entity]
- Drone Inspection Relay [serverless]
- Satellite Failover Gateway [managed_service]

New or changed flows:

- Mutual Aid Contractor Console -> Vendor Access Broker: temporary contractor onboarding request
- Drone Inspection Relay -> Operations Data Lake: wildfire imagery upload
- Drone Inspection Relay -> Outage Command Center: asset damage alert
- Field Technician Tablet -> Satellite Failover Gateway: degraded field sync
- Satellite Failover Gateway -> Work Order Dispatch Service: low-bandwidth work package sync

Why risk changes:

- Temporary mutual-aid access expands the privileged identity surface under crisis conditions.
- Drone imagery adds new sensitive infrastructure reconnaissance and supply-chain trust concerns.
- Satellite failover introduces a second sync path that can bypass assumptions built around the primary mobile channel.
